NEW DOCUMENT: TM1 Immutability Policy v1.0

Exact Language (copy verbatim into your whitepaper / compliance folder):
Immutability Enforcement – Write-Once Policy
All quote artifacts generated by the Voice Quote Engine (Beep™) for Help Assembly Services LLC are governed by strict immutability rules:
Write-Once Principle: Once a quote artifact is created (voice → structured quote → job booking), it is never overwritten or deleted. Any change (price adjustment, status update, GPS ping, final invoice) creates a new immutable event record. The original artifact remains untouched.
Hashing: Every quote artifact is hashed with SHA-256 at creation. The hash is stored with the record and cannot be

altered. Any tampering attempt is cryptographically detectable.
Version Stamping: Every artifact carries a unique version stamp in the format v{MAJOR}.{MINOR}_{YYYYMMDD_HHMMSS}_{UUID}. Version stamps are immutable and sequential.
Append-Only Architecture: Quote events are stored in an immutable quote_events table. No UPDATE or DELETE operations are permitted on core quote fields (quoted_price, details at booking time). PostgreSQL row-level security + database triggers enforce this at the storage layer.
Regulatory-Grade Positioning Statement
Help Assembly Services LLC operates under full immutability enforcement. All customer quote artifacts are write-once, cryptographically hashed, and version-stamped. This provides audit-grade, tamper-evident records suitable for

regulatory review, insurance, and financial compliance.
If artifacts are immutable once written → You gain regulatory-grade positioning.
This policy is now active in TM1.
